IBN E HASSAN

Senior Backend Engineer | Ruby on Rails | APIs, Data Pipelines & AI Integration

Lahore, Pakistan | +92 324 4441259 (WhatsApp) | ibn.e.hasssan@gmail.com | github.com/hassanfcs | linkedin.com/in/hassanfcs | Open to remote roles and relocation

PROFESSIONAL SUMMARY

Backend engineer with 6+ years building Ruby on Rails systems for enterprise field-operations software, Apple device management, healthcare, and government contracting. Owns REST and GraphQL APIs, SFTP data-ingestion pipelines, Sidekiq background-job infrastructure, and third-party integrations in production, including an MDM platform serving 100K+ users and parsers that handle millions of records a day. Ships AI features to production (RAG, vector search, GPT-4o, LangGraph) and holds the Claude Certified Developer credential. Leads small teams, sets testing standards, and runs sprint planning, grooming, and code review.

TECHNICAL SKILLS

Backend:	Ruby, Ruby on Rails, Python, FastAPI, Node.js, Express, TypeScript, JavaScript, SQL
APIs & Architecture:	RESTful APIs, GraphQL, Microservices, Service-Oriented Architecture, Webhooks, Third-Party Integrations, MVC, Data Modeling, System Design
Data & Async:	Sidekiq, Redis, ActiveJob, SFTP Ingestion Pipelines, ETL & Data Parsers, Rate Limiting, Query Optimization
Databases:	PostgreSQL, MySQL
AI / LLM:	OpenAI GPT-4o, RAG, Vector Search, Embeddings (Google Vertex AI), LangGraph, MCP, Prompt Engineering, Claude Code
Cloud & DevOps:	Google Cloud (Cloud Run, Vertex AI), AWS, Docker, Harness CI/CD, GitHub Actions, Heroku, Git, GitLab
Testing & Quality:	RSpec, Selenium, Unit & Integration Testing, Code Review, Production Debugging, API Metrics & Monitoring
Frontend:	React, Next.js, MUI, Tailwind CSS, Liquid Templates
Ways of Working:	Agile, Scrum, Sprint Planning, Backlog Grooming, Retrospectives, Team Leadership, Mentoring

PROFESSIONAL EXPERIENCE

Senior Software Engineer | Tech-Bros | Lahore, Pakistan (remote clients) Mar 2023 – Present

Backend engineer on long-running client engagements delivered through Tech-Bros, a software services firm.

FORM (GoSpotCheck) · Ruby Engineer Nov 2025 – Present

Enterprise field-execution platform used by Fortune 500 consumer-goods, retail, and hospitality brands across thousands of locations.

- Build and maintain the Ruby on Rails services behind GoSpotCheck web and its internal toolkit as one of a 3-engineer Ruby team, deployed on Google Cloud with Harness CI/CD.
- Own SFTP data-ingestion flows that load customer data into the platform; hardened parsing, validation, and Sidekiq retry handling so imports fail less and recover without manual intervention.
- Improve customer-facing PDIL dashboards: fixed data-accuracy defects and optimized the slow queries behind them.
- Run research spikes on open technical questions and write up findings so tickets are scoped before sprint commitment.
- Drive sprint planning, backlog grooming, and retrospectives with the PM, and review pull requests across the team.

TekSystems (Fortune 50 technology client) · Software Engineer, contract 2024 – 2025

One-year engagement building internal hardware-lifecycle tools for a global technology company.

- Built Recycle it from scratch to replace a manual process for retired hardware, tracking every device through audit, reuse, shipment, and vendor consignment for the internal hardware reuse and retirement programs.
- Mapped how the operations team handled devices by hand, then turned it into the Reuse Request feature so devices go to internal staff or outside vendors instead of scrap, extending device lifecycle and recovery value.

- Engineered a Rails/PostgreSQL device trade-in portal that verifies authenticity through IMEI/serial checks and Find My status, and automates CSV reporting of serials and configurations; led a team of two engineers.

SimpleMDM · Senior Software Engineer Mar 2023 – 2024

Cloud mobile device management (MDM) product for Apple devices serving 100K+ users, with Apple Business Manager enrollment, app deployment, and a public REST API.

- Developed the Rails backend and REST APIs implementing Apple's MDM protocol for macOS, iOS, and iPadOS: zero-touch Automated Device Enrollment, live device status, and remote lock, wipe, and software-update commands.
- Rewrote the parsers for incoming product data, which process millions of records a day, to cut bad records, and added UI-driven filtering so admins find records quickly.
- Moved API syncs, file parsing, and data imports into Sidekiq jobs on Redis, taking them out of the request cycle and reducing API response times.
- Built an API metrics dashboard showing response times and data usage per endpoint, used to find and fix slow endpoints.
- Led a two-person team: reviewed pull requests, set RSpec testing standards, and migrated legacy ERB views to React with MUI.

Belle Health Care · Software Engineer 2023

In-home healthcare provider delivering foot-care and telehealth visits to Medicare and health-plan members.

- Integrated the CareLink scheduling API so appointments are booked automatically instead of entered by hand, cutting scheduling errors.
- Built Liquid templates, an admin interface to manage them, and AfterParty tasks so the team changes generated content without code deploys.

Software Engineer | Delta Labs | Lahore, Pakistan Sep 2020 – Feb 2023

Curbside Health

Healthcare platform for patient-provider interactions and record management.

- Led the migration from a Rails monolith to a GraphQL API with a separate React front end; pages loaded faster and backend and frontend shipped on independent release schedules.
- Built GraphQL and REST endpoints, PostgreSQL schemas, and the backend logic for patient and provider records.
- Wrote RSpec controller and model specs for code with little coverage, reducing production bugs.
- Added CKEditor rich-text editing and dynamic page breaks to the document editor.
- Debugged production issues, mentored junior engineers, and worked in Scrum sprints with product, QA, and design.

PocketMed

Telehealth platform with chat, structured questionnaires, and medication e-commerce.

- Developed a real-time chat system for secure patient-doctor communication.
- Designed a state machine to manage structured medical questionnaires and patient actions, and built the online store module for medication purchases.

KEY PROJECTS

Solicitation Tracker Client project | Aug 2026 – Present

AI system that matches companies to US government contract solicitations using RAG, vector search, and GPT-4o, with LangGraph agents and Redis-backed rate limiting around the LLM calls. Python, FastAPI, OpenAI GPT-4o, Google Vertex AI embeddings, LangGraph, Redis, PostgreSQL, Cloud Run.

EDUCATION

BS Computer Science | Punjab University College of Information Technology (PUCIT), Lahore 2016 – 2020

CERTIFICATIONS & AWARDS

- Claude Certified Developer – Foundations, Anthropic, Oct 2026
- Google Code Jam, Google Kick Start, and national-level programming competition certificates
